Abstract

Motor learning was assessed with an accelerating rotarod.

1 The task was done using a rotarod apparatus (Panlab) equipped with a mouse rod (3 cm diameter) and set to 4–40 rpm acceleration over 300 seconds.

2 The task consisted of daily sessions (five trials per session; intertrial-interval = 15 s, max trial duration = 300 s)

3 Mice were placed on the accelerating rotarod. The time of mouse fell from the rod was recorded. The mean of 5 trials is used for the final analysis
