ABSTRACT

The purpose of this document is give glass-electrode half-cell calibration procedure with aqueous buffers.

PARENT PROTOCOLS

In steps of
Unified pH measurement

BEFORE STARTING

BEFORE STARTING

Turn on the thermostat and electrometer at least half an hour before starting the work.

Software

1 Start Quick IV Measurement Software.

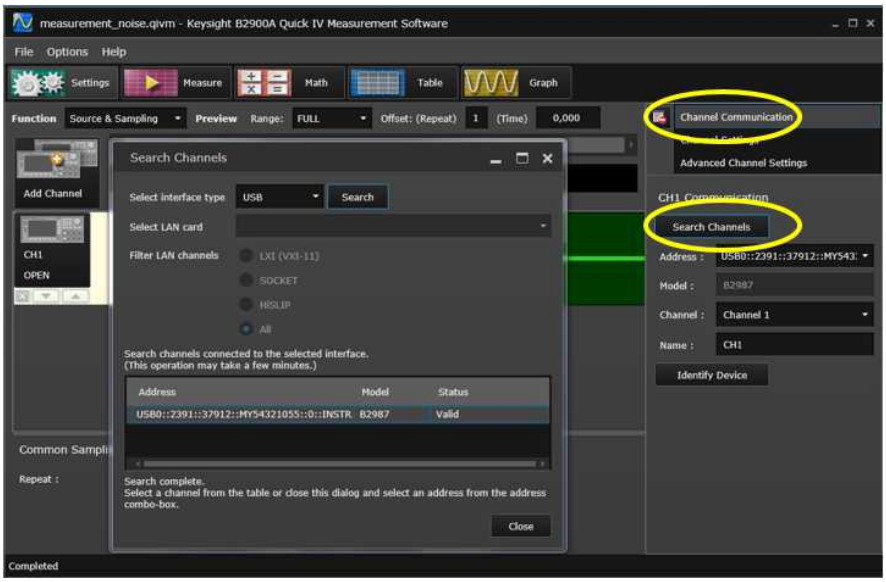
Computer cannot go to sleep during measurements or the communication between computer and instruments is lost and data collection stops.

2 On the left hand pick Function “Source & Sampling”.

Position of the Function choice “Source & Sampling”.

Alternatively, open previously saved QIVM file with measurement settings.

3 Right hand side click on tab “Channel Communication”. Click on “Search Channels”, which opens a new window. Select USB interface and search for the channel. After the search, click on the channel name to choose the channel and close the window.



Position of the tabs “Channel Communication” and “Search Channels”.

This must be done every time the program is started.

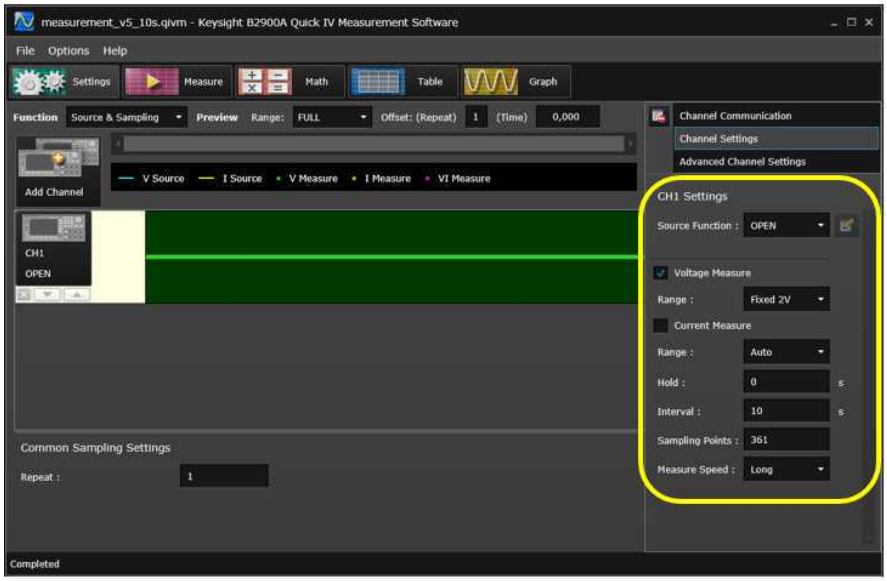
4 Settings can be saved as QIVM file, which can be used for measurements. The saved file can be opened under tab “File”. The settings will remain the same between the measurements if the program is not closed.



Program settings.

Range is "Fixed 20V" in case of EST-0601 calibration, otherwise it is "Fixed 2V".

Filling the cell 8m

5 

25 °C

Special water-jacketed glass cell from Gebr. Rettberg.

UT cell
Special water-jacketed glass cell
Rettberg **Glass cell**

VistaShield
Faraday cage
Gamry **VistaShield**

U2c
Thermostat
MLW **U2c**

The side ports must be open.

A beaker can also be used if temperature is controlled.

6 Fill capillary with standard aqueous buffer with pH 7.00. **50 mL** 2m

7 Insert a glass electrode and a reference electrode. 2m

K401
Calomel reference electrode
Radiometer **K401**

7.1 Electrode is rinsed with water, gently dried, and then rinsed with solution to be measured. 2m

8 Connect electrodes to the instrument.

B2987A Electrometer / High Resistance Meter
Electrometer
Keysight **B2987A**

8.1 Crocodile clips are as following:
red is signal and connects to the glass electrode,
black is shield and is connected to reference electrode and
green is guard. Green stays unused.

Cable goes through the port in Faraday cage. Electrometer is not in the Faraday cage.

N1415A Triax to Alligator Cable
Cable
Keysight Technologies **N1415A**

Measurement 1h

9 Start the measurement by clicking on the "Measure" button on the upper panel.

10 Data collection. Point is taken at 10 s interval. 1h

Calibration duration must be the same as later used in pH measurements.

11 Save data. Files are named as Date_GE_vs_ref_pHx.

SAVE THE FILE BEFORE NEW MEASUREMENT! Otherwise, data is lost. Data is given in volts and seconds.

Citation: Agnes Heering, Ivo Leito, Markus Lahe, Martin Vilbaste (09/24/2021). Calibration of glass electrode half-cells.
https://dx.doi.org/10.17504/protocols.io.byh2pt8e

11.1 Go to table view, right click on the table, choose “Export as CSV…” and save the results. The data can be automatically imported into excel file while measuring or after (both under “Excel Navigation”), but this causes constant shift in the comma position.

Washing

12 Remove the electrodes.

13 Remove the solution.

14 Rinse three times with plenty of water **20 mL each**

15 Rinse once with acetone to ease the drying. **5 mL**

16 Dry cell with compressed air.

Measurement

17 Repeat measurements with standard buffers pH 4 and pH 10.

Data analysis

18 Points from 30 min to 60 min are used for analysis.

19 Take the average of the chosen data points.

20 Plot ΔE vs pH.
