ABSTRACT

Objectives: To investigate the performance of serial Alberta Stroke Program Early CT Score (ASPECTS)
assessment for predicting stroke-associated pneumonia (SAP) in patients with thrombolyzed
acute anterior circulation ischemic stroke (AACIS).
Materials and Methods: A retrospective
observational cohort study of adult patients with thrombolyzed AACIS was conducted. Baseline and 24-hour ASPECTS using non-contrast computed tomography (NCCT), complications of stroke, including SAP and swallowing dysfunction
using the Modified Water Swallowing test, were collected. Receiver operating characteristic curves using binary logistic regression and a multivariable logistic regression model were generated to compare the predictive performance.
