## ABSTRACT

### Background:

No studies have comprehensively assessed the quality of studies related to COVID-19 in preprints [11]. Hence, we will conduct a meta-epidemiological study based on the following research question: Are the quality of COVID-19 RCT and SR articles in medRxiv lower than those indexed in PubMed?

### Methods:

We will conduct a meta-epidemiological cross-sectional study. We will include randomized controlled trial articles and systematic review articles indexed in PubMed or MedRxiv from 1<sup>st</sup> January to 15<sup>th</sup> June 2020. We will include articles of COVID-19 patients or healthcare workers engaged in the care of COVID-19 patients. We will exclude study protocols. We will evaluate the characteristics of included studies, methodological quality, number of mentions on social networking sites (SNS), and citations. We will use chi-squared test, logistic regression analysis, and linear regression analysis as appropriate. Two-tailed p values will be considered statistically significant if less than 0.05.

### Ethical consideration:

We will only use openly available data. There is no need to make ethical considerations.
