## ABSTRACT

The author describes a new image analysis algorithm that enables identification of how many DNA fragments co-migrate during PFGE. The method is named factor of co-migration based on exponential correlation between single-fragment bands and their pixel densities "FCM-ECSB".

## GUIDELINES

It is well known that in order to estimate a DNA band size in any electrophoresis technique, a molecular weight marker is run alongside test DNA. The same rule applies for our method. Factor of co-migration is defined as 'The number of DNA fragments that appear as a single band in the gel due to resolution limitations of the gel or simply, because more than one band have the same length'.

Image analysis algorithm of this protocol is named "factor of co-migration based on exponential correlation between single-fragment bands and their pixel densities (FCM-ECSB)"

## DISCLAIMER:

The described FCM-ECSB method is patented to the first and second authors of the cited article. Accordingly, the use of any one of previously mentioned methods and/or algorithms without permission for upgrading image analysis software or any bioinformatics tool, creating another web or any offline software that consume any of the methods/algorithms is considered a financial conflict of interests. However, It is OK to use this protocol by means of described methods.

The full article is available

## BEFORE STARTING

This protocol requires gel image analysis software. The program should be able to provide band intensity profiles alongside band sizes and marker exponential equation (correlation coefficient:  $R^2$ ).

For this demonstration, GelAnalyzer 2010a will be used. Make sure that you have java runtime environment (JRE) is installed on your system. for more information on how to use this software, please refer to its user manual here: [gelanalyzer.com/downloads/users\\_manual\\_2010.pdf](http://gelanalyzer.com/downloads/users_manual_2010.pdf)

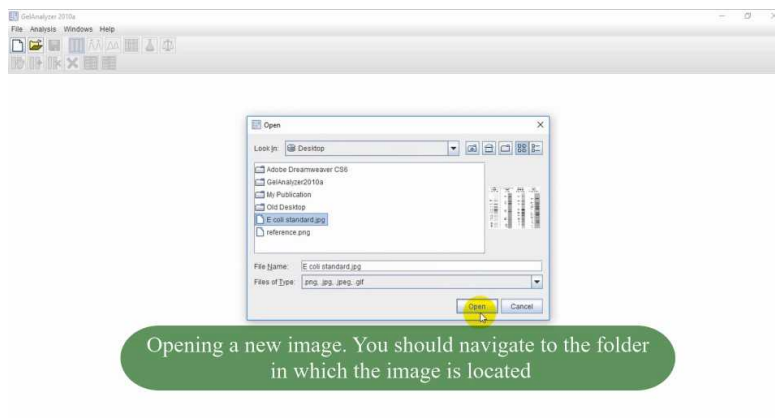

For FCM-ECSB calculations, raw pixel density data alongside band sizes should be transferred to a statistical package (Paleontological Statistics: PAST will be used) in order to obtain the correlation and regression equation for calculating expected pixel density (EPD). Finally, MS Excel will be used to calculate the expected values of FCM.

## IMAGE PROCESSING

### 1 Launch the program

#### 1.1 Open PFGE image of interest. You should navigate to containing folder first.

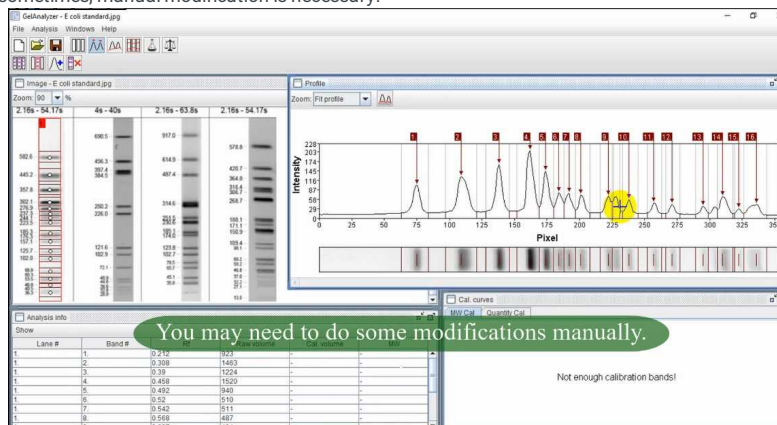

## 1.2

It is critical to tell the program if DNA bands are white in a black background or otherwise.

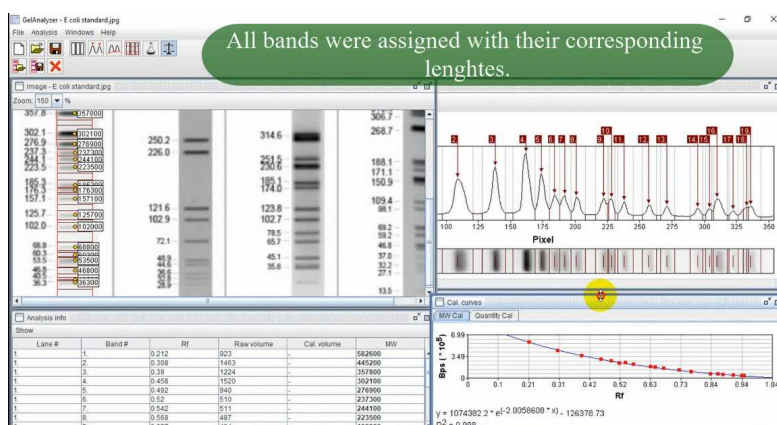

You should select either bands are black on white background or vise-versa

## 1.3 Define lanes and then bands. sometimes, manual modification is necessary.

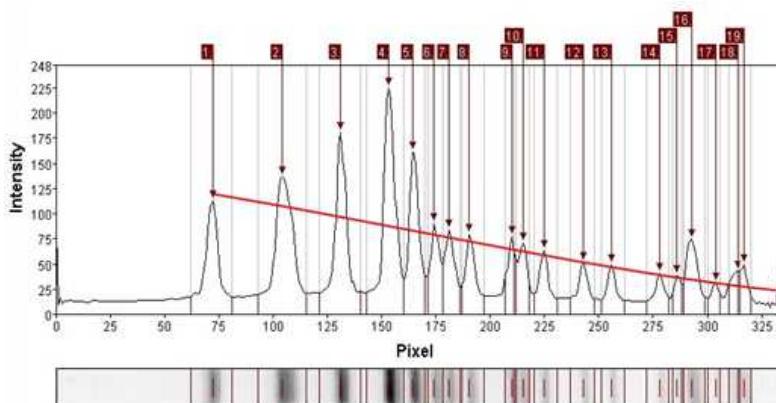

## 1.4 Select the lane that shows the DNA ladder. then indicate each band with its corresponding size. (Sizes are in kilo base-pair (kbp). you should multiply each value by 1000 to get accurate results).

## 2 CALCULATING EXPECTED PIXEL DENSITIES FOR CO-MIGRATED DNA FRAGMENTS

This step is critical. It is based on end-user's estimation. Keep in mind that co-migrated fragments show high pixel densities (Intensity profiles). band intensities should reduce as you go down the profile (toward smaller band sizes).

The red line roughly indicate expected band intensities across the whole profile.

### 2.1 Copy all the data from "Analysis info." from GelAnalyzer2010a. Press Ctrl + A to copy data.

Analysis info					
Show					
Lane #	Band #	Rf	Raw volume	Cal. volume	MW
1.	1.	0.212	923	-	582600
1.	2.	0.308	1463	-	445200
1.	3.	0.39	1224	-	357800
1.	4.	0.458	1520	-	302100
1.	5.	0.492	940	-	276900
1.	6.	0.52	510	-	237300
1.	7.	0.542	511	-	244100
1.	8.	0.568	487	-	223500
1.	9.	0.627	434	-	185300
1.	10.	0.644	311	-	176300
1.	11.	0.672	395	-	157100
1.	12.	0.726	326	-	125700
1.	13.	0.756	298	-	102000
1.	14.	0.833	257	-	68800
1.	15.	0.859	173	-	60300
1.	16.	0.876	507	-	53500
1.	17.	0.91	171	-	46800
1.	18.	0.941	146	-	40500
1.	19.	0.949	283	-	36300

Notice that "Raw volumes" are intensity profiles corresponding each band size "MW".

### 2.2 Open PAST statistics. The goal is to get a polynomial equation with significantly high $R^2$ value. Past the data copied from GelAnalyzer2010a and past it into PAST statistics. Change column attributes to indicate (Band size) and (Pixel density).

$$EPD = -6.651E - 11 * BS^2 + 0.0013 * BS + 191.2$$

EPD: expected pixel density, BS: band size

### 3 DENOTATION OF ALL BAND SIZES INTO THE EQUATION (from step 2.4):

This step requires the same two columns from step 2.2. Open Microsoft Office™ Excel. Past the two previously mentioned columns. Start denotation of column "Band size" into the equation. Use an empty column.

Let's switch to MS Excel to calculate expected pixel densities (EPDs) and finally our FCMs

BandSize	Expected pixel density	Observed pixel density
582600	926.0049922	923
445200	756.7775158	1463
357800	647.8253339	1224
302100	577.8600041	1520
276900	546.0704382	940
237300	495.9447361	510
244100	504.5670143	511
223500	478.4276759	487
185300	429.8063067	434
176300	418.3227568	311
157100	393.7885059	395
125700	353.5591094	326
102000	323.10803	298
68800	280.3251789	257
60300	269.3481637	173
53500	260.5206318	507
46800		

Denotation process.

Let's switch to MS Excel to calculate expected pixel densities (EPDs) and finally our FCMs

BandSize	Expected pixel density	Observed pixel density
582600	926.0049922	923
445200	756.7775158	1463
357800	647.8253339	1224
302100	577.8600041	1520
276900	546.0704382	940
237300	495.9447361	510
244100	504.5670143	511
223500	478.4276759	487
185300	429.8063067	434
176300	418.3227568	311
157100	393.7885059	395
125700	353.5591094	326
102000	323.10803	298
68800	280.3251789	257
60300	269.3481637	173
53500	260.5206318	507
46800		

Expected pixel densities are ready. notice how close expected and observed PDs are close for bands number 1,8,9 and 11. we can safely conclude that they represent single DNA fragments. While expected PD of band number 2 is half the observed one.

### 3.1 In order to calculate approximate number of DNA fragments represented by each PFGE band, we must simply divide observed PDs by the corresponding ones. column is named "O/E" indicating observed/expected.

Let's switch to MS Excel to calculate expected pixel densities (EPDs) and finally our FCMs

BandSize	O/E	Expected pixel density	Observed pixel density
582600	0.996755	926.0049922	923
445200	1.931197	756.7775158	1463
357800	1.889398	647.8253339	1224
302100	2.630395	577.8600041	1520
276900	1.72139	546.0704382	940
237300	1.02834	495.9447361	510
244100	1.01275	504.5670143	511
223500	1.017918	478.4276759	487
185300	1.009757	429.8063067	434
176300	0.743445	418.3227568	311
157100	1.003077	393.7885059	395
125700	0.922052	353.5591094	326
102000	0.922292	323.10803	298
68800	0.916792	280.3251789	257
60300	0.642291	269.3481637	173
53500	1.943812	260.5206318	507
46800			

### 3.2 FCMs are simply truncated values of O/E column.

Let's switch to MS Excel to calculate expected pixel densities (EPDs) and finally our FCMs

	A	B	C	D	E	F	G	H	I	J	K
1	BandSize	FCM				O/E		Expected pixel density	Observed pixel density		
2	582600	1				0.996755		926.0049922	923	1	1
3	445200	2				1.933197		756.7775158	1463	1	2
4	357800	2				1.889398		647.8253339	1224	1	3
5	302100	2				2.630395		577.8600041	1520	1	4
6	276900	2				1.72139		546.0704382	940	1	5
7	237300	1				1.02834		495.9447361	510	1	6
8	244100	1				1.01275		504.5670143	511	1	7
9	223500	1				1.017918		478.4276759	487	1	8
10	185300	1				1.009757		429.8063067	434	1	9
11	176300	1				0.743445		418.3227568	311	1	10
12	157100	1				1.003077		393.7885059	395	1	11
13	125700	1				0.922052		353.5591094	326	1	12
14	102000	1				0.922292		323.10803	298	1	13
