If you see a protocol that you are interested in using, you have 4 options:

- use the protocol as is without changing it,
- make a "fork", and then you can change your fork to whatever you want and distribute it to whomever you want,
- make a "version", and then you will be able to contribute your improvements to the protocol e.g. add pictures, sample data, movies, detailed tips, etc. that everyone would benefit from (this will trigger a request for permission to go to the owner),
- request to be a member of the CSC workspace and get editing privileges for the protocol you want to edit directly.
