## Protocol

- 1 Differential transcript usage was performed using DRIMSeq (v1.24.0). To consider only genes containing more than 1 isoform, with a minimum level of expression, the following parameters were used:  
 $\text{min\_samps\_gene\_expr} = n * 0.75$ ,  $\text{min\_gene\_expr} = 10$ ,  $\text{min\_samps\_feature\_expr} = 10$ ,  $\text{min\_feature\_expr} = 10$ ,  $\text{min\_samps\_feature\_prop} = 10$ ,  $\text{min\_feature\_prop} = 0.1$ .
