### ABSTRACT

Novel Object Recognition Test for mice

- 1 Individualize each mouse in a different cage with new bedding.
- 2 Expose the animal to two identical objects for habituation.
- 3 After 24h change one of the two objects for a new one.
- 4 Measure the time the animal spends exploring the new object and the old object.
- 5 Calculate the discrimination index using the formula:  $[\text{time exploring the new object} - \text{time exploring the familiar object}] / \text{total time}$ .
