Created: April 30, 2020

Last Modified: April 30, 2020

Protocol Integer ID: 36430

Keywords: ultra ii directional rna library prep kit, bulk rna, rna, rna into high quality, mrna enrichment, rrna depletion method, magnetic isolation module, illumina platform, illumina

Abstract

The NEBNext Ultra II Directional RNA Library Prep Kit for Illumina contains the enzymes and buffers required to convert a broad range of input amounts of RNA into high quality directional (strand-specific) libraries for next-generation sequencing on the Illumina platform. The fast, user-friendly workflow has minimal hands-on time and is compatible with poly(A) mRNA enrichment and rRNA depletion methods.

Guidelines

Section 1

RNA Sample Requirements

RNA Integrity:

Assess the quality of the Input RNA by running the RNA sample on an Agilent Bioanalyzer® RNA 6000 Nano/Pico Chip. For PolyA mRNA enrichment, high quality RNA with a RIN score > 7 is required.

RNA Sample Requirements:

The RNA sample should be free of salts (e.g. Mg²⁺, or guanidinium salts, divalent cation chelating agents (e.g. EDTA or EGTA) or organics (e.g. phenol or ethanol). RNA must be free of DNA. gDNA is a common contaminant from RNA preps. It may be carried over from the interphase of organic extractions or when the silica matrix of solid phase RNA purification methods is overloaded. If the total RNA sample may contain gDNA contamination, treat the sample with DNase I to remove all traces of DNA (DNase is not provided in this kit). After treatment with DNase I the enzyme should be removed from the sample. Any residual activity of the DNase I may degrade the oligos necessary for the enrichment. DNase I can be removed from the extraction using phenol/chloroform extraction and ethanol precipitation.

The protocol is optimized for approximately 200 bp RNA inserts. To generate libraries with longer RNA insert sizes, refer to Appendix A (Chapter 6) for recommended fragmentation times and size selection conditions.

Troubleshooting

Safety warnings

- ❗ Please refer to the SDS (Safety Data Sheet) for safety warnings and hazard information.

Before start

Input Amount Requirement: 10 ng–1 µg DNA-free total RNA quantified by Qubit® Fluorometer and quality checked by Bioanalyzer. The protocol is optimized for approximately 200 bp RNA inserts. To generate libraries with longer RNA insert sizes, refer to Appendix A (Section 6) for recommended fragmentation times and size selection conditions.

Keep all the buffers on ice, unless otherwise indicated.

Isolate RNA

- 1 Pulverize fresh frozen tissue in liquid nitrogen with a mortar and pestle and isolate RNA using the Quiagen All Prep Kit with final elution in  40 µL Nuclease-free water. Store at  -80 °C .
- 2 Using Qubit, quantify RNA concentration given in  0 ng/µl .
- 3 With Bioanalyzer, check RNA quality. Should see 2 rRNA peaks. RIN value should be above 6.

Probe Hybridization to RNA

- 4 Prepare the First Strand Synthesis Reaction Buffer and Random Primer Mix (2X) in a nuclease-free microcentrifuge tube as follows:

| | Component | Volume |
|--|--|---------------|
| | NEBNext First Strand Synthesis Reaction Buffer | 8 µl |
| | NEBNext Random Primers | 2 µl |
| | Nuclease-free Water | 10 µl |
| | Total Volume | 20 µl |

You can prepare the first strand synthesis reaction buffer later in the protocol, but it is important that it is ready before the elution in step 38. The beads should not be allowed to dry out.

- 5 Mix thoroughly by pipetting up and down 10 times.

Note

Keep the mix on ice until mRNA is purified. It will be used in Step 38 and 41.

mRNA Isolation (rRNA-depletion), Fragmentation and Priming Starting with Total RNA

- 6 Dilute the total RNA with nuclease-free water to a final volume of $\text{50 } \mu\text{L}$ in a nuclease-free 0.2 ml PCR tube and keep on ice.
- 7 To wash the Oligo dT Beads, add the following to a 1.5 ml nuclease-free tube. If preparing multiple libraries, beads for up to 10 samples can be added to a single 1.5 ml tube for subsequent washes (use magnet NEB #S1506 for 1.5 ml tubes). The purpose of this step is to bring the beads from the storage buffer into the binding buffer. The 2X Binding Buffer does not have to be diluted for this step.

| | Component | Volume Per One Library |
|--|-----------------------|-------------------------------------|
| | Oligo dT Beads d(T)25 | 20 μl |
| | RNA Binding Buffer | 100 μl |
| | Total Volume | 120 μl |

- 8 Wash the beads by pipetting up and down 6 times.
- 9 Place the tube on the magnet and incubate at room temperature until the solution is clear (~ 00:02:00).
- 10 Remove and discard all of the supernatant from the tube. Take care not to disturb the beads.
- 11 Remove the tube from the magnetic rack.
- 12 Add $\text{100 } \mu\text{L}$ RNA Binding Buffer (2X) to the beads and wash by pipetting up and down six times. If preparing multiple libraries, add $\text{100 } \mu\text{L}$ RNA Binding Buffer (2X) per sample. The Binding Buffer does not have to be diluted.
- 13 Place the tubes on the magnet and incubate at room temperature until the solution is clear (~ 00:02:00).

- 14 Remove and discard the supernatant from the tube. Take care not to disturb the beads.
- 15 Add pipette icon $50 \mu\text{L}$ RNA Binding Buffer (2X) to the beads and mix by pipetting up and down until beads are homogenous. If preparing multiple libraries, add pipette icon $50 \mu\text{L}$ RNA Binding Buffer (2X) per sample. This first binding step removes most of the non target RNA.
- 16 Add $50 \mu\text{l}$ beads to each RNA sample from Step 2. Mix thoroughly by pipetting up and down 6 times.
- 17 Place the tube in a thermocycler and close the lid. Heat the sample at thermocycler icon 65°C **for** timer icon 00:05:00 **and cool to** thermocycler icon 4°C **with the heated lid set at \geq** thermocycler icon 75°C to denature the RNA and facilitate binding of the mRNA to the beads.
- 18 Remove the tube from the thermocycler when the temperature reaches thermocycler icon 4°C .
- 19 Mix thoroughly by pipetting up and down 6 times. Place the tube on the bench and incubate at room temperature for timer icon 00:05:00 to allow the mRNA to bind to the beads.
- 20 Place the tube on the magnetic rack at room temperature until the solution is clear (~ timer icon 00:02:00).
- 21 Remove and discard all of the supernatant. Take care not to disturb the beads.
- 22 Remove the tube from the magnetic rack.
- 23 Wash the beads by adding pipette icon $200 \mu\text{L}$ of Wash Buffer to the tube to remove unbound RNA. Gently pipette the entire volume up and down 6 times to mix thoroughly.
- 24 Place the tube on the magnetic rack at room temperature until the solution is clear (~ timer icon 00:02:00).
- 25 Remove and discard all of the supernatant from the tube. Take care not to disturb the beads.

- 26 Remove the tube from the magnetic rack.
- 27 Repeat steps 20–23.
 go to step #23 Repeat
- 28 Add 50 µl of Tris Buffer (provided in NEB #E7490 kit) to each tube. Gently pipette up and down 6 times to mix thoroughly.
- 29 Place the tube on the thermocycler. Close the lid and heat the samples at  80 °C **for**  00:02:00 , then cool to  25 °C **with the heated lid set at ≥**  90 °C to do the first elution of the mRNA from the beads.
- 30 Remove the tube from the thermocycler when the temperature reaches  25 °C .
- 31 Add 50 µl of RNA Binding Buffer (2X) to the sample to allow the mRNA to re-bind to the beads. Mix thoroughly by gently pipetting up and down six times.
- 32 Incubate the tube at **room temperature for**  00:05:00 .
- 33 Place the tube on the magnetic rack at room temperature until the solution is clear (~  00:02:00).
- 34 Remove and discard the supernatant from the tube. Take care not to disturb the beads.
- 35 Remove the tube from the magnetic rack.
- 36 Wash the beads by adding  200 µL of Wash Buffer. Gently pipette the entire volume up and down 6 times to mix thoroughly.
- 37 Spin down the tube briefly to collect the liquid from the wall and lid of the tube.

Note

It is important to spin down the tube to prevent carryover of the Wash Buffer in subsequent steps.

- 38 Place the tube on the magnet at room temperature until the solution is clear (~  00:02:00).

- 39 Remove and discard all of the supernatant from the tube. Take care not to disturb the beads that contains the mRNA.

Note

It is important to remove all of the supernatant to successfully fragment the mRNA in the subsequent steps. Spin down the tube. Place the tube on the magnetic rack and with a 10 μ L tip, remove all of the wash buffer. (Caution: Do not disturb beads that contain the mRNA). Avoid letting the beads dry out before adding elution buffer.

- 40 Remove the tube from the magnetic rack.

Note

[!] The next step provides a fragmentation incubation time resulting in an RNA insert size of ~ 200 nt. For RNA insert sizes > 200 nt, refer to Chapter 6 (Appendix A) for recommended fragmentation times in Step 39.

- 41 To elute the mRNA from the beads and fragment, add  11.5 μ L of the First Strand Synthesis Reaction Buffer and Random Primer Mix (2X) prepared in Step 2, pipette up and down six times to resuspend the beads.

- 42 Incubate the sample in a thermocycler with the heated lid set at  105 °C as follows:
 00:15:00 **at**  94 °C
Hold at  4 °C *

*Immediately transfer the tube to ice for  00:01:00 as soon as it is cool enough to handle (~  65 °C)

- 43 Quickly spin down the tube in a microcentrifuge to collect the liquid from the sides of the tube and place on the magnet right away until the solution is clear (~1–2 minutes).
- 44 Collect the fragmented mRNA by transferring  10 µL of the supernatant to a nuclease-free 0.2 ml PCR tube.

Note

If the supernatant volume recovered is less than 10 µl for any reason, bring the volume up to 10 µl by adding the First Strand Synthesis Reaction Buffer and Random Primer Mix (2X) prepared in Step 2 and continue with the protocol.

Note

Avoid transferring any of the magnetic beads.

- 45 Place the tube **on ice** and proceed directly to First Strand cDNA Synthesis.

First Strand cDNA Synthesis

- 46 Assemble the first strand synthesis reaction **on ice** by adding the following components to the fragmented and primed RNA from Step 42:

| | First Strand Synthesis Reaction | Volume |
|--|---|---------------|
| | Fragmented and Primed RNA (Step 36) | 10 µl |
| | NEBNext Strand Specificity Reagent | 8 µl |
| | NEBNext First Strand Synthesis Enzyme Mix | 2 µl |
| | Total Volume | 20 µl |

NEBNext Strand Specificity Reagent New England Biolabs Catalog #E7766

 NEBNext First Strand Synthesis Enzyme Mix New England
Biolabs Catalog #E7761

- 47 Mix thoroughly by pipetting up and down 10 times.
- 48 [!] Incubate the sample in a preheated thermocycler with the heated lid set at $\geq 80^{\circ}\text{C}$ as follows:

Note: If you are following recommendations in Appendix A (Chapter 6), for libraries with longer inserts (> 200 bases), increase the incubation at 42°C from 15 minutes to 50 minutes at Step 2 below.

Step 1:  00:10:00 at  25°C

Step 2:  00:15:00 at  42°C

Step 3:  00:15:00 at  70°C

Step 4: Hold at  4°C

- 49 Proceed directly to Second Strand cDNA Synthesis.

Second Strand cDNA Synthesis

- 50 Assemble the second strand cDNA synthesis reaction **on ice** by adding the following components into the first strand synthesis product from Step 46).

| | Second Strand Synthesis Reaction | Volume |
|--|---|------------------------------------|
| | First Strand Synthesis Product (Step 46) | 20 μl |
| | NEBNext Second Strand Synthesis Reaction Buffer with dUTP (10X) | 8 μl |
| | NEBNext Second Strand Synthesis Enzyme Mix | 4 μl |
| | Nuclease-free Water | 48 μl |
| | Total Volume | 80 μl |

 NEBNext Second Strand Synthesis Reaction Buffer with dUTP Mix New England
Biolabs Catalog #E7426

NEBNext Second Strand Synthesis Enzyme Mix New England Biolabs Catalog #E7425

Nuclease-free Water New England Biolabs Catalog #E7764

51 Keeping the tube on ice, mix thoroughly by pipetting up and down at least 10 times.

52 Incubate in a thermocycler for  01:00:00 at  16 °C with the heated lid set at  40 °C (or off).

Purification of Double-stranded cDNA Using SPRIselect Beads or NEBNext Sample Purification Beads

53 Vortex SPRIselect Beads or NEBNext Sample Purification Beads to resuspend.

NEBNext Sample Purification Beads New England Biolabs Catalog #E7767

54 Add  144 µL (1.8X) of resuspended beads to the second strand synthesis reaction (~  80 µL). Mix well on a vortex mixer or by pipetting up and down at least 10 times.

55 Incubate for  00:05:00 at room temperature.

56 Briefly spin the tube in a microcentrifuge to collect any sample on the sides of the tube. Place the tube on a magnet to separate beads from the supernatant. After the solution is clear, carefully remove and discard the supernatant. Be careful not to disturb the beads, which contain DNA.

Caution: Do not discard beads.

57 Add  200 µL of freshly prepared 80% ethanol to the tube while in the magnetic rack. Incubate at room temperature for  00:00:30, and then carefully remove and discard the supernatant.

Fresh 80% Ethanol

58 Repeat Step 54 once for a total of 2 washing steps.

 go to step #57 Repeat Step

59 Air dry the beads for up to 5 minutes while the tube is on the magnetic rack with lid open.

Caution: Do not over-dry the beads. This may result in lower recovery of DNA target. Elute the samples when the beads are still dark brown and glossy looking, but when all visible liquid has evaporated. When the beads turn lighter brown and start to crack, they are too dry.

- 60 Remove the tube from the magnetic rack. Elute the DNA from the beads by adding  53 µL 0.1X TE Buffer (provided) to the beads. Mix well on a vortex mixer or by pipetting up and down at least 10 times. Quickly spin the tube and incubate for  00:02:00 at room temperature. Place the tube on the magnetic rack until the solution is clear.

 (0.1X) TE Buffer New England Biolabs Catalog #E7763

- 61 Remove  50 µL of the supernatant and transfer to a clean nuclease-free PCR tube.

Note

If you need to stop at this point in the protocol samples can be stored at -20°C.

End Prep of cDNA Library

- 62 Assemble the end prep reaction on ice by adding the following components to the second strand synthesis product from Step 58.

| | End Prep Reaction | Volume |
|--|---|--------------|
| | Second Strand Synthesis Product (Step 58) | 50 µl |
| | NEBNext Ultra II End Prep Reaction Buffer | 7 µl |
| | NEBNext Ultra II End Prep Enzyme Mix | 3 µl |
| | Total Volume | 60 µl |

If a master mix is made, add  10 µL of master mix to  50 µL of cDNA for the End Prep reaction.

 NEBNext Ultra II End Prep Reaction Buffer New England Biolabs Catalog #E7647

 NEBNext Ultra II End Prep Enzyme Mix New England Biolabs Catalog #E7646

- 63 Set a 100 µl or 200 µl pipette to 50 µl and then pipette the entire volume up and down at least 10 times to mix thoroughly. Perform a quick spin to collect all liquid from the sides of the tube.

Note

It is important to mix well. The presence of a small amount of bubbles will not interfere with performance.

- 64 Incubate the sample in a thermocycler with the heated lid set at ≥  75 °C as follows.

 00:30:00 at  20 °C

 00:30:00 at  65 °C

Hold at  4 °C

- 65 Proceed immediately to Adaptor Ligation.

Adaptor Ligation

- 66 [!] Dilute the NEBNext Adaptor* prior to setting up the ligation reaction in ice-cold Adaptor Dilution Buffer and keep the adaptor on ice.

| | Total RNA Input | Dilution Required |
|--|-----------------|--|
| | 1,000 ng–250 ng | 5-fold dilution in Adaptor Dilution Buffer |
| | 249 ng–100 ng | 25-fold dilution in Adaptor Dilution Buffer |
| | 99 ng–10 ng | 100-fold dilution in Adaptor Dilution Buffer |

*The NEBNext adaptor is provided in NEBNext oligos kit. NEB has several oligo kit options, which are supplied separately from the library prep kit.

- 67 Assemble the ligation reaction **on ice** by adding the following components, in the order given, to the end prep reaction product from Step 62.

| | Ligation Reaction | Volume |
|--|---------------------------|--------|
| | End Prepped DNA (Step 62) | 60 µl |

| | |
|--------------------------------------|-------------------------------|
| Diluted Adaptor (Step 63) | 2.5 μ L |
| NEBNext Ligation Enhancer | 1 μ L |
| NEBNext Ultra II Ligation Master Mix | 30 μ L |
| Total Volume | 93.5 μL |

Note

The Ligation Master Mix and Ligation Enhancer can be mixed ahead of time and is stable for at least 8 hours @ $\text{4 }^{\circ}\text{C}$. We do not recommend premixing the Ligation Master Mix, Ligation Enhancer and adaptor prior to use in the Adaptor Ligation Step.

☒ NEBNext Ligation Enhancer New England Biolabs Catalog #E7374

☒ NEBNext Ultra II Ligation Master Mix New England Biolabs Catalog #E7648

- 68 Set a 100 μ L or 200 μ L pipette to 80 μ L and then pipette the entire volume up and down at least 10 times to mix thoroughly. Perform a quick spin to collect all liquid from the sides of the tube.

[!] Caution: The NEBNext Ultra II Ligation Master Mix is very viscous. Care should be taken to ensure adequate mixing of the ligation reaction, as incomplete mixing will result in reduced ligation efficiency. The presence of a small amount of bubbles will not interfere with performance.

- 69 Incubate **15 minutes at 20°C** in a thermocycler.

⌚ 00:15:00 Incubate

- 70 Add $\text{3 } \mu\text{L}$ (blue) USER™ Enzyme to the ligation mixture from Step 60, resulting in total volume of $\text{96.5 } \mu\text{L}$

☒ NEBNext USER Enzyme New England Biolabs Catalog #E7458

- 71 Mix well and incubate at $\text{37 }^{\circ}\text{C}$ **for 00:15:00** with the heated lid set to $\geq \text{45 }^{\circ}\text{C}$.

72 Proceed immediately to Purification of the Ligation Reaction.

Purification of the Ligation Reaction Using SPRIselect Beads or NEBNext Sample Purification Beads

73 [!] Note: If you are selecting for libraries with larger insert size (> 200 nt) follow the size selection recommendations in Appendix A, Chapter 6.

Add  87 µL (0.9X) resuspended SPRIselect Beads or NEBNext Sample Purification Beads and mix well on a vortex mixer or by pipetting up and down at least 10 times.

 NEBNext Sample Purification Beads New England Biolabs Catalog #E7767

74 Incubate for  00:10:00 at room temperature.

75 Quickly spin the tube in a microcentrifuge and place the tube on an appropriate magnetic rack to separate beads from the supernatant. After the solution is clear (~  00:05:00), discard the supernatant that contains unwanted fragments.

Caution: Do not discard beads.

76 Add  200 µL of freshly prepared 80% ethanol to the tube while in the magnetic rack. Incubate at room temperature for  00:00:30, and then carefully remove and discard the supernatant.

 80% Ethanol (freshly prepared)

77 Repeat Step 73 once for a total of 2 washing steps.

 go to step #76 Repeat Step

78 Briefly spin the tube, and put the tube back in the magnetic rack.

79 Completely remove the residual ethanol, and air dry beads until the beads are dry for up to 5 minutes while the tube is on the magnetic rack with the lid open.

[!] **Caution: Do not over-dry the beads. This may result in lower recovery of DNA target. Elute the samples when the beads are still dark brown and glossy looking, but when all visible liquid has evaporated. When the beads turn lighter brown and start to crack, they are too dry.**

- 80 Remove the tube from the magnetic rack. Elute DNA target from the beads by adding  17 µL 0.1X TE (provided) to the beads. Mix well on a vortex mixer or by pipetting up and down. Quickly spin the tube and incubate for  00:02:00 at room temperature. Put the tube in the magnet until the solution is clear.
- 81 Without disturbing the bead pellet, transfer  15 µL of the supernatant to a clean PCR tube and proceed to PCR enrichment.

Note

If you need to stop at this point in the protocol samples can be stored at -20°C.

PCR Enrichment of Adaptor Ligated DNA

- 82 [!] Check and verify that the concentration of your oligos is **10 µM** on the label.

[!] Use **Option A** for any NEBNext oligos kit where index primers are supplied in tubes. These kits have the forward and reverse primers supplied in separate tubes.

Use **Option B** for any NEBNext oligos kit where index primers are supplied in a 96-well plate format. These kits have the forward and reverse (i7 and i5) primers combined.

- 83 Set up the PCR reaction as described below based on the type of oligos (PCR primers) used.

Option A: Forward and Reverse Primers Separate:

| | Component | Volume Per One Library |
|--|------------------------------------|-------------------------------|
| | Adaptor Ligated DNA (Step 78) | 15 µl |
| | NEBNext Ultra II Q5 Master Mix | 25 µl |
| | Universal PCR Primer/i5 Primer*,** | 5 µl |

| | |
|--------------------------------|--------------|
| Index (X) Primer/i7 Primer*,** | 5 µl |
| Total Volume | 50 µl |

Option B: Forward and Reverse Primers Combined:

| Component | Volume Per One Library |
|---------------------------------|------------------------|
| Adaptor ligated DNA (Step 78) | 15 µl |
| NEBNext Ultra II Q5 Master Mix | 25 µl |
| Index (X)/Universal Primer Mix* | 10 µl |
| Total Volume | 50 µl |

* NEBNext Oligos must be purchased separately from the library prep kit. Refer to the corresponding NEBNext Oligo kit manual for determining valid barcode combinations.

** Use only one i7 primer/ index primer per sample. Use only one i5 primer (or the universal primer for single index kits) per sample

- 84 Mix well by gently pipetting up and down 10 times. Quickly spin the tube in a microcentrifuge.
- 85 Place the tube on a thermocycler with the heated lid set to  105 °C and perform PCR amplification using the following PCR cycling conditions (refer to Table 82.A and Table 82.B):

Table 82.A:

| Cycle Step | Temp | Time | Cycles |
|----------------------|-------|------------|----------|
| Initial Denaturation | 98° C | 30 seconds | 1 |
| Denaturation | 98° C | 10 seconds | 8–16*,** |
| Annealing/Extension | 65° C | 15 seconds | |
| Extension | 72°C | 20 seconds | |
| Final Extension | 72°C | 5 minutes | 1 |

| | | | | |
|--|------|-----|----------|--|
| | Hold | 4°C | ∞ | |
|--|------|-----|----------|--|

* The number of PCR cycles should be adjusted based on RNA input.

** It is important to limit the number of PCR cycles to avoid overamplification. If overamplification occurs, a second peak ~ 1,000 bp will appear on the Bioanalyzer trace (See Figure 7.2 in Manual).

Table 82.B: Recommended PCR cycles based on total RNA input amount:

| Total RNA Input | Recommended PCR Cycles |
|-----------------|------------------------|
| 1,000 ng | 8–9 |
| 100 ng | 12–13 |
| 10 ng | 15–16 |

Note: PCR cycles are recommended based on high quality Universal Human Reference Total RNA. It may require optimization based on the sample quality to prevent PCR over-amplification.

Purification of the PCR Reaction using SPRIselect Beads or NEBNext Sample Purification Beads

- 86 Vortex SPRIselect Beads or NEBNext Sample Purification Beads to resuspend.
- 87 Add PCR tube 45 μL (0.9X) of resuspended beads to the PCR reaction (~ PCR tube 50 μL). Mix well on a vortex mixer or by pipetting up and down at least 10 times.
 NEBNext Sample Purification Beads New England Biolabs Catalog #E6315
- 88 Incubate for timer 00:05:00 at room temperature.
- 89 Quickly spin the tube in a microcentrifuge and place the tube on an appropriate magnetic rack to separate beads from the supernatant. After the solution is clear (~ timer 00:05:00), carefully remove and discard the supernatant. Be careful not to disturb the beads that contain DNA targets.

Caution: Do not discard beads.

- 90 Add $\text{200 } \mu\text{L}$ of freshly prepared 80% ethanol to the tube while in the magnetic rack. Incubate at room temperature for $00:00:30$, and then carefully remove and discard the supernatant.

- 91 Repeat [go to step #90](#) once for a total of 2 washing steps.
- 92 Air dry the beads for up to 5 minutes while the tube is on the magnetic rack with the lid open.
- Caution: Do not over-dry the beads. This may result in lower recovery of DNA target. Elute the samples when the beads are still dark brown and glossy looking, but when all visible liquid has evaporated. When the beads turn lighter brown and start to crack, they are too dry.**
- 93 Remove the tube from the magnetic rack. Elute the DNA target from the beads by adding $\text{23 } \mu\text{L}$ 0.1X TE (provided) to the beads. Mix well on a vortex mixer or by pipetting up and down ten times. Quickly spin the tube in a microcentrifuge and incubate for $00:02:00$ at room temperature. Place the tube in the magnetic rack until the solution is clear.
- 94 Transfer $\text{20 } \mu\text{L}$ of the supernatant to a clean PCR tube, and store at -20°C .

Assess Library Quality on an Agilent Bioanalyzer DNA Chip

- 95 Run $\text{1 } \mu\text{L}$ library on a DNA 1000 chip. If the library yield is too low to quantify on this chip, please run the samples on a DNA High Sensitivity chip. A dilution may be necessary for running on a Bioanalyzer High Sensitivity DNA Chip.
- 96 Check that the electropherogram shows a narrow distribution with a peak size approximately 300 bp.

Note

Note: If a peak at ~ 80 bp (primers) or 128 bp (adaptor-dimer) is visible in the bioanalyzer traces, bring up the sample volume (from Step 85) to 50 μ l with 0.1X TE buffer and repeat the SPRIselect Bead or NEBNext Sample Purification Bead Cleanup Step (Section "Purification of the PCR Reaction using SPRIselect Beads or NEBNext Sample Purification Beads").
