Streptococcal protein G by Sigma Aldrich

- 1 This ELISA is used to study the interaction of streptococcal protein-G (SpG) with different avian immunoglobulins.
- 2 The 96 well microtitre plate is coated overnight at 4°C with 2 μg/μl per well of SpG in carbonate-bicarbonate buffer pH 9.6.
- 3 Then plate is treated with bovine serum albumin solution and washed 4X with PBS-Tween.

Universal sandwich ELISA for investigating the binding of avian immunoglobulins to Streptococcal protein-G (SpG) using anti-IgY-peroxidase conjugate. . <a href="https://dx.doi.org/10.17504/protocols.io.bjgvkmw6">https://dx.doi.org/10.17504/protocols.io.bjgvkmw6</a>

4	$50\mu l$ of avian egg yolk or egg white (1 mg/ml) is added and incubated for 1.30h at room temperature and the microplate is then rewashed 4X with PBS-Tween.
5	Then 50 $\mu$ l of peroxidase-labeled-anti-IgY conjugate diluted 1:15000 in PBS-non-fat milk is added to each well and incubated for 1.30h at RT. The plate is washed 4X with PBS-Tween.
6	Pipette 50 μl of TMB (Sigma-Aldrich) to each well.
7	The reaction is stopped with 50 µl of 3M H2SO4 solution.
8	The plate is visually assessed for the development of colour and read in a microplate reader at 450 nm.
9	A cut-off point should be calculated as the mean of the optical density of negative controls x 3. The higher the OD value the higher will be the affinity of SpG to mammalian immunoglobulins.
