Coronavirus Method Development Community

ABSTRACT

This is a fast "gunk to graph" protocol for analysing viral RNA from nasopharyngeal swabs. The approach involves swab lysis and inactivation at the point of sampling, uses a cellulose binding / wash protocol to reduce extraction cost, incorporates sample-specific barcodes during first-strand synthesis, nanopore rapid-attachment primers during PCR amplification, and nanopore sequencing with parallel RAMPART analysis for fast assembly and phylogenetics.

MATERIALS

NAME ~	CATALOG #	VENDOR V
Q5 Hot Start High-Fidelity 2X Master Mix - 500 rxns	M0494L	New England Biolabs
MinION sequencer	View	Oxford Nanopore Technologies
ONT MinION Flow Cell R9.4.1	FLO-MIN106D	Oxford Nanopore Technologies

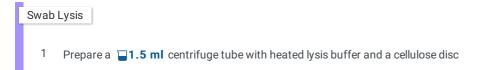

MATERIALS TEXT

Additional materials TBA.

SAFETY WARNINGS

This protocol is UNTESTED, and is in the early stages of development. Do not trust the protocol; question everything.

Assume samples are potentially infectious during extraction, and make sure to use proper sterile technique to avoid cross-contamination.

- 1.1 Add **500** µl lysis / RNAse inactivation buffer (Twitter reference) to 1.5ml centrifuge tube:
 - [M] 10 Milimolar (mM) Tris
 - [M] 10 Milimolar (mM) EDTA
 - [M]0.5 % volume SDS
 - [M]150 Milimolar (mM) NaCl

OR **500** µl extraction buffer #2 (see paper):

- [M]800 Milimolar (mM) guanidine hydrochloride
- [M]50 Milimolar (mM) Tris [pH 8]
- [M] 0.5 % volume Triton X100
- [M]1 % volume Tween-20
- 1.2 Add a **3 mm diameter** punched disc from Whatman #1 filter paper (see paper)
- 1.3 Preheat 1.5 ml tube to 60 °C
- 2 Collect sample using a sterile polystyrene swab with a 30mm breakpoint (e.g. <u>Puritan 25-3606-U; PurFlock Ultra 6" Sterile Elongated Flock Swab w/Polystryene Handle, 30mm Breakpoint</u>).

RNA Wash

- 3 Transfer disc to a new **1.5 ml** tube containing **200 μl** wash buffer using a pipette tip to remove contaminants:
 - [M]10 Milimolar (mM) Tris [pH 8.0]
 - [M]0.1 % volume Tween-20
- 4 Incubate tube at § Room temperature for © 00:01:00

cDNA Synthesis

5 Transfer disc to a new **200 μl** PCR tube using a pipette tip

Add the following additional components into the 200 µl PCR tube (see the Nanopore protocol for Sequence-specific cDNA-PCR Sequencing (SQK-PCS109)) in a □11 µl reaction: ■ 1 μl x [M]2 Micromolar (μM) reverse primers □1 μl x [M]10 Milimolar (mM) dNTPs ■9 µl RNAse-free water Reverse primers should be prefixed with sample-specific barcode sequences (if used) and the ONT reverse anchor sequence, i.e. [5' - ACTTGCCTGTCGCTCTATCTTC - [barcode] - [sequence-specific] - 3'] A potential primer pool are the reverse/right ARCTIC primers with barcodes and ONT anchor sequences from here. An alternative protocol using both forward and reverse primers can be found here. Mix gently by flicking the tube and spin down © 00:00:05 Denature RNA and anneal primers at 8 65 °C for © 00:05:00 and then snap cool on a pre-chilled freezer block for © 00:01:00 In a separate tube, mix together the following in an $\square 8 \mu I$ reaction: ■ **4 μl** 5X RT Buffer ■1 µl RNAseOUT □1 µl Nuclease-free water **2 μl** x [M] **10 Micromolar (μM)** ONT Strand-switching primer (SSP) 10 Mix gently by flicking the tube and spin down © 00:00:05 Add the strand-switching buffer to the snap-cooled, annealed RNA, mix by flicking the tube and spin down 11 12 Incubate at & 42 °C for © 00:02:00 Add 11 µl of Maxima H Minus Reverse Transcriptase, to a total volume of 20 µl

Mix gently by *flicking the tube* and spin down **© 00:00:05**

14

15 Incubate using the following protocol:

Cycle step	Temperature	Time	No. of cycles
Reverse transcription and strand-switching	42° C	90 mins	1
Heat inactivation	85° C	5 mins	1
Hold	4° C	∞	

Thermal cycler settings for reverse transcription and strand switching

PCR amplification

- 16 In four new **200 μl** PCR tubes, prepare the following reaction at **§ Room temperature** in a **50 μl** reaction:
 - 25 μl 2X Q5 Hot Start High-Fidelity Master Mix
 - 1.5 μl cDNA primer (cPRM)
 - 18.5 µl Nuclease-free water
 - **3** μl Reverse-transcribed cDNA from the previous step (pool, or single sample)
- 17 Amplify using the following cycling conditions:

Cycle step	Temperature	Time	No. of cycles
Initial denaturation	95 °C	30 secs	1
Denaturation	95 °C	15 secs	10-40*
Annealing	62 °C	15 secs	10-40*
Extension	65 °C	50 secs per kb	10-40*
Final extension	65 °C	6 mins	1
Hold	4°C	∞	

Thermal cycler settings for PCR amplification

- Add 18 Add 19 pl of NEB Exonuclease 1 (20 units) directly to each PCR tube to remove unextended primers. Mix by *pipetting*.
- 19 Incubate the reaction at § 37 °C for © 00:15:00 , followed by § 80 °C for © 00:15:00
- 20 Run 1µl of amplified product on a gel (or similar length-based QC device) to verify that amplified products exist at the expected length. Because this is a strand-switch protocol, there may be a smear of template DNA rather than specific bands.

Bead Cleanup

- 21 Add 160 μl of resuspended AMPure XP beads to the **1.5 ml** tube and mix by *pipetting*
- 22 Incubate on a gentle agitator (e.g. hula mixer or rotator mixer) for ③ 00:05:00 at & Room temperature

^{*} Starting from viral RNA, the recommended starting point is 20 cycles - adjust this depending on experimental needs.

23 Spin down © 00:00:05 the sample and pellet on a magnet. Keep the tube on the magnet, and pipette off the supernatant. 24 Keep the tube on the magnet and wash the beads with **200** µl of freshly-prepared [M]70 % volume ethanol without disturbing the pellet. Remove the ethanol using a pipette and discard. 25 Repeat the previous step: wash with 200 µl [M]70 % volume ethanol, and discard the ethanol / wash liquid. 26 Spin down $\odot 00:00:05$ and place the tube back on the magnet. Pipette off any residual ethanol. Allow to dry for © 00:00:30 [at most] but do not dry the pellet to the point of cracking (the magnetic beads should just start to lose their shiny sheen). 27 Remove the tube from the magnetic rack and resuspend pellet in 12 µl of Elution Buffer (EB). 28 Incubate at & Room temperature for © 00:10:00 29 Pellet beads on magnet **© 00:05:00** until the eluate is clear and colourless 30 While still on the magnet, carefully remove and retain 12 µl of eluate into a clean 15 ml Eppendorf DNA LoBind tube Quantify 1 µl of the amplified cDNA library using the Quantus Fluorometer using the ONE dsDNA assay (see ncov 2019 31 sequencing protocol, step 16) Adapter Addition 32 Add 11 ul of Rapid Adapter (RAP) to the amplified cDNA library 33 Mix by *pipetting* and spin down **© 00:00:05** Incubate the reaction for © 00:05:00 at § Room temperature 35 Store the prepared library & On ice until ready to load onto a flow cell. Nanopore Sequencing 36 Load 20 ng sequencing library onto a MinION flow cell (see ncov 2019 sequencing protocol, step 21)

 37 Start the sequencing run using MinKNOW, using SQK-PCS109 as the sample preparation protocol (see ncov2019 sequencing protocol, step 22)

RAMPART Analysis

38 Analyse the run results using RAMPART (see https://artic.network/ncov-2019/ncov2019-using-rampart.html)
