Overview

Immune repertoire sequencing is a powerful tool that can be used to analyze the immune response to diseases and pathogens from current and past exposures. Areas of particular interest include characterization of autoimmune diseases, oncology, discovery of neutralizing antibodies against infectious disease, or use as a diagnostic tool for residual disease detection.

In order to create the incredible genetic diversity required for antigen recognition by B and T Cells, lymphocytes construct unique antigen receptors via a process known as V(D)J recombination. In this

1

Citation: maria.matos , New England Biolabs NEBNextî Immune Sequencing Kit (Human)ÃÂ (E6320) https://dx.doi.org/10.17504/protocols.io.q26q74b83qwz/v1 process, each cell selects a single V, D, and J gene segment through genetic recombination, introducing additional non-germline-encoded nucleotides at the junctions. This process generates immune receptor diversity, the majority of which is encoded in the heavy chain complementarity determining region 3 (CDR3) (Figure 1).

Recent improvements in the read length and throughput of next-generation sequencing (NGS) platforms have resulted in a rise in the popularity of immune repertoire sequencing. The complex structure and sequence diversity of antibody-encoding genes have provided significant challenges to the development of a simple and reliable method to sequence immune receptor sequences.

The NEBNext Immune Sequencing Library Preparation Kit (Figure 2) provides all the components required for enrichment and sequencing of the B Cell Receptor (BCR) and T Cell Receptor (TCR) RNA transcripts present in a sample. NEBNext Immune Sequencing Kit has been developed and optimized to provide accurate sequencing of full-length immune transcript repertoires of B-cells and T-cells. This allows for exhaustive somatic mutation profiling across complete V, D and J segments, full isotype information analysis (IgM, IgD, IgG, IgA and IgE), and also allows for synthesis and expression of complete antibody chains for downstream immunological assays. In addition, this approach allows characterization of TRA and TRB chains. The method uses unique molecular identifier scheme specifically designed to barcode each mRNA molecule, allowing PCR copies derived from an individual mRNA to be collapsed into a single consensus sequence. This improves sequence accuracy by resolving PCR and sequencing errors. This also eliminates PCR bias, thus allowing for quantitative digital molecule counting.

Defining features of the Immune Sequencing method include:

- a) Full-length variable sequences are generated (including isotype information), allowing downstream antibody synthesis and functional characterization not possible with approaches sequencing only the CDR3 region.
- b) Variable region primers are not required, which reduces primer pool complexity and allows for the unbiased and simultaneous recovery of B Cell and T Cell receptor transcripts.
- c) Unique molecular barcoding approach minimizes PCR biases and improves sequencing accuracy by allowing a consensus to be generated from duplicate sequencing reads originating from the same transcript. Moreover, unique barcoding enables accurate quantitation of each clone present in the sample.
- d) High target capture efficiency allows for immune repertoire sequencing and analysis from sub-microgram quantities of total RNA.

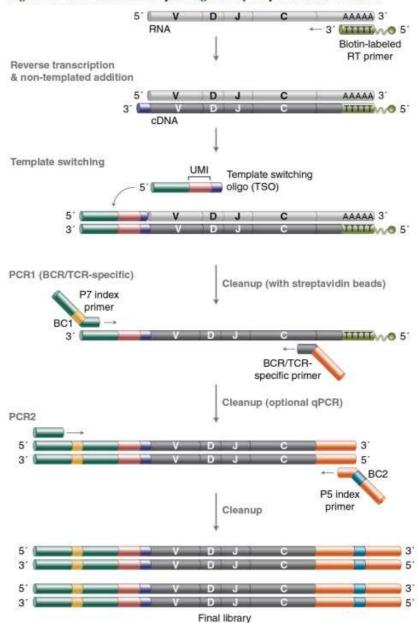

Figure 2. NEBNext Immune Sequencing Library Preparation Kit Workflow

Step I-Prepare target RNA

Immune Sequencing does not require mRNA isolation prior to library construction. Total RNA can be prepared from any sample or tissue known to contain B Cells or T Cells, such as peripheral blood mononuclear cells, bone marrow, lymph nodes, or any other tissue in which infiltrating lymphocytes are present. Cells or tissues can be frozen, but intact, high quality RNA is required for optimal performance.

Step II-Perform molecular-tagging reverse transcription

During this 50-minute reaction full-length mRNA is reverse transcribed and the 3' end of each cDNA is tagged with a DNA adaptor containing a unique molecular identifier (UMI) barcode.

Step III-Purify with Streptavidin Magnetic Beads

This 30-minute cleanup step removes all salts, reagents and unused cDNA adaptor oligonucleotides (TSO and RT Primers) allowing clean downstream amplification steps.

Step IV-Primary amplification of target fragments

This primary PCR step uses one primer which binds the universal cDNA adaptor and a primer mix targeting constant regions of the desired immune receptors. Products are then purified with Sample Purification Beads.

Step V-Secondary PCR cycle optimization with real-time PCR

This optional real-time PCR allows accurate assessment of target quantity leading to an optimized choice of PCR cycles for the final library PCR.

Step VI-Secondary PCR including Illumina® adaptor addition

This secondary PCR adds additional Illumina adaptor sequences to the target fragments (including Illumina multiplexing index sequences if desired). After Sample Purification Bead cleanup the libraries are ready for Bioanalyzer or TapeStation analysis, quantification and sequencing on the MiSeq platform.

Applications

The NEBNext Immune Sequencing Kit (Human) contains enzymes and buffers that are ideal to convert a small amount of human RNA input into indexed libraries for next-generation sequencing on the Illumina® MiSeq platform (Illumina, Inc). The workflow of NEBNext Immune Sequencing (Human) Kit is very user-friendly and fast with minimal hands-on time. Each of these components must pass rigorous quality control standards and are lot controlled, both individually and as a set of reagents.

For larger volume requirements, customized and bulk packaging is available by purchasing through the OEM/Bulks department at NEB. Please contact OEM@neb.com for further information.

The Kit Includes:

NEB #E6320S contains E2628S (Pouch with BCR and TCR primers), #E6325-1 (Box 1 of 2), and #E6325-2 (Box 2 of 2) and is sufficient for preparation of up to 24 reactions. NEB #E6320L contains E2628L (Pouch with BCR and TCR primers), #E6325-3 (Box 1 of 2), and #E6325-4 (Box 2 of 2) and is sufficient for preparation of up to 96 reactions. All reagents should be stored at $t-20^{\circ}$ C, t° C or Room temperature as indicated below. Colored bullets represent the color of the cap of the tube containing the reagent.

NEBNext Immune Sequencing Reverse Transcription and cDNA Synthesis

RNA Sample Recommendations: The RNA sample should be free of salts (e.g., Mg2+, or guanidine salts) or organics (e.g., phenol and ethanol). High quality RNA with a RIN > 7 is recommended for optimal performance.

Starting Material: 10 ng - 1 µg enriched B cell or T Cell or B cell and T Cell total RNA, or 10 ng -□1 µg total RNA from peripheral blood mononuclear cells (PBMCs). The maximum volume of RNA input is **■9** μL.

Mix the following components in a sterile nuclease-free tube:

Α	В
COMPONENT	VOLUME
(lilac) NEBNext IS RT Buffer (4X)	5 μΙ
(lilac) NEBNext IS RT Primer	1 μΙ
(lilac) NEBNext IS TS Oligos	1 μΙ
(lilac) dNTP Solution Mix	2 μΙ
(lilac) NEBNext First Strand Synthesis Enzyme Mix	2 μΙ
(lilac) NEBNext Cell Lysis Buffer	0.5 μΙ
Total RNA	1-9 μΙ
(white) Nuclease-free Water	Variable
Total Volume	20.5 µl

Set a 100 µl or 20 µl pipette to 15 µl and then pipette the entire volume up and down at least 10 times to mix thoroughly. Perform a quick spin to collect all liquid from the sides of the tube.

It is important to mix well. The presence of a small amount of bubbles will not interfere with the performance.

3

Place in a thermal cycler, with the heated lid set to ≥ \$80 °C, and run the following program:

Α	В	С
CYCLE STEP	TEMP	TIME
Incubation	42°C	40 minutes
Inactivation	70°C	10 minutes
Hold	4°C	∞

Purify the cDNA with Streptavidin Magnetic Beads

4 Prepare Bind and Wash Buffer (1X) to be used in Step 14.

4.1

Dilute NEBNext IS Bind and Wash Buffer (2X) to 1X with an equal volume of nuclease-free water (not provided).

For each sample, you will need $\blacksquare 100 \, \mu L$ Bind and Wash Buffer (1X).

5

Vortex Streptavidin Magnetic Beads to resuspend. Aliquot the total amount of Streptavidin Magnetic Beads needed (15 µL of Streptavidin Magnetic Beads per sample) into a clean RNase-free 1.5 mL tube.

- 6 Place the tube on a magnetic rack at **§ Room temperature**. Once the solution is clear (~ © **00:02:00**) carefully remove and discard the supernatant without disturbing the bead pellet.
- 7 🗐 🎢 🏡

- 8 Place the tube on a magnetic rack. Once the solution is clear, carefully remove and discard the supernatant without disturbing the bead pellet.
- 9

remove and discard the supernatant without disturbing the bead pellet for a total of two washes.

10

Remove the tube from the magnetic rack. Resuspend the beads in $\Box 20 \,\mu L$ of undiluted NEBNext IS Bind and Wash Buffer (2X) for each sample (e.g., for 4 samples, add 4 x 20 = $\Box 80 \,\mu L$ NEBNext IS Bind and Wash Buffer (2X). Vortex briefly to resuspend the beads.

11

- 12 Place the tube on a rotator for © 00:15:00 at & Room temperature.
- Quickly spin down the tube to collect any sample on the sides of the tube and place the tube on a magnetic rack.

 Once the solution is clear, carefully remove and discard the supernatant without disturbing the bead pellet.

15m

14

Remove the tube from the magnetic rack. Add $\blacksquare 100~\mu L$ diluted Bind and Wash Buffer (1X) (from Step 4). Vortex briefly to resuspend the beads.

Vortexing is better than flicking the tube, as it minimizes foaming.

- Quickly spin down the tube to collect any sample on the sides and place the tube on a magnetic rack. Once the solution is clear, carefully remove and discard the supernatant without disturbing the bead pellet.
- 16 / \(\lambda \)

Remove the tube from the magnetic rack and add $\Box 100~\mu L$ of 0.1% Tween. Vortex briefly to resuspend the beads.

This step is critical to remove all the salt from the beads before elution.

17

Quickly spin down the tube to collect any sample on the sides of the tube and place the tubes on a magnetic rack. Once the solution is clear, carefully remove and discard the supernatant without disturbing the bead pellet. With a 20 ul pipette tip, carefully remove any residual liquid left at the bottom of the tube without disturbing the beads.

18

Remove the tube from the magnet and add \blacksquare 23 μ L of 0.1% Tween. Vortex briefly to resuspend the beads and quickly spin in a microcentrifuge to collect any sample on the sides of the tube.

19

Place the tube in a thermal cycler, with the heated lid set at 8 105 °C , and run the following program:

Α	В	С
CYCLE STEP	TEMP	TIME
Incubation	95°C	3 minutes
Hold	25°C	∞

20 🔀

Remove the tube from the thermal cycler, vortex briefly, spin down the contents and place on the magnetic rack.

21

Once the solution is clear, transfer $\blacksquare 21 \,\mu L$ of the supernatant into a new tube and discard the beads.

Safe Stopping Point:

22

- Use Option 22.1 for enriching B Cell Receptor (BCR) chains.
- Use Option 22.2 for enriching T Cell Receptor (TCR) chains.
- Use Option 22.3 for enriching both BCR chains and TCR chains.

Step 22 includes a Step case.

B Cell Receptor Chains PCR 1

T Cell Receptor Chains PCR 1

B and T Cell Receptor Chains PCR 1

step case

B Cell Receptor Chains PCR 1

23

Add the following components to a sterile strip tube:

Α	В
COMPONENT	VOLUME
Purified cDNA (Step 21)	21 μΙ
(blue) Q5 Reaction Buffer (5X)	10 μΙ
(lilac) dNTP Solution Mix	1 μΙ
(blue) Q5 Hot Start High-Fidelity DNA Polymerase	1 μΙ
(blue) NEBNext IS BCR Primers (Human)	2 μΙ
(blue) NEBNext i7 Index Primer*	1 μΙ
(white) Nuclease-free Water	14 μΙ
Total Volume	50 μΙ

^{*}Use only one i7 Primer per sample

24

Set a 100 ul or 200 ul pipette to 40 ul and then pipette the entire volume up and down at least 10 times to mix thoroughly. Perform a quick spin to collect all liquid from the sides of the tube.

25

Place the tube on a thermal cycler and perform PCR amplification using the following PCR cycling program:

A	В	С	D
CYCLE STEP	TEMP	TIME	CYCLES
Initial Denaturation	98°C	60 seconds	1
Denaturation	98°C	10 seconds	12
Annealing	64°C	30 seconds	
Extension	72°C	30 seconds	
Final Extension	72°C	60 seconds	1
Hold	4°C	∞	

41m

Cleanup of PCR1 Amplification

30m

Vortex NEBNext Sample Purification Beads to resuspend. SPRIselect and AMPure® XP Beads can be used as well. If using AMPure XP Beads, please allow the beads to warm to **§ Room temperature** for at least **© 00:30:00** before use.

27

Add $\blacksquare 50~\mu L$ of resuspended NEBNext Sample Purification Beads to each 50 μl PCR reactions. Mix well by pipetting or brief vortexing.

Incubate for © 00:05:00 at & Room temperature.

29 🕲 🎊

Quickly spin the tube in a microcentrifuge and place it on a magnetic rack. Once the solution is clear (~ \odot **00:05:00**) carefully remove and discard the supernatant without disturbing the bead pellet.

Caution: Do not discard beads.

30 30s

Wash beads by adding $200 \,\mu$ of freshly prepared 80% ethanol to the tube while in the magnetic rack. Incubate at 8 Room temperature for 00:00:30, and then carefully remove and discard the supernatant.

Incubate at $8 \, \text{Room temperature}$ for 00:00:30, and then carefully remove and discard the supernatant once for a total of two wash steps. After supernatant is discarded, use a 20 μ l pipette tip to carefully remove any

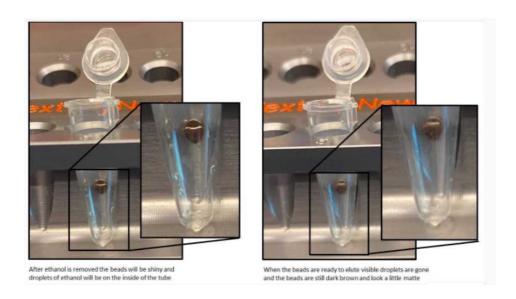

32 🛕

5m

Air dry the beads with more emphasis for up to © 00:05:00 while the tube is on the magnetic stand with the lid open.

Caution: Do not over dry the beads. This may result in lower recovery of DNA target.

residual liquid left at the bottom of the tube without disturbing the beads.

33

2m

Elute DNA target from beads by adding $\blacksquare 25~\mu L$ TE (0.1X) to beads. Mix well on a vortex mixer or by pipetting up and down at least 10 times. Incubate for at least @ 00:02:00 at & Room temperature. Quickly spin the tube and place it on a magnetic rack to separate beads from supernatant.

34

The qPCR step is optional; it is only used to identify the optimal final PCR cycling conditions, as each sample can contain varying amounts of amplifiable molecules. One can achieve a similar result by manually taking an aliquot of the PCR reaction every 5 cycles and visualizing each aliquot on Bioanalyzer or TapeStation to identify the optimal cycling number that yields the highest product with the lowest background. The number of cycles should be high enough to provide sufficient library fragments for a successful sequencing run, but low enough to avoid PCR artifacts and over-cycling (high molecular weight fragments on Bioanalyzer). Typically, most samples will amplify best in the range of 6–18 cycles.

Add the following components to a sterile strip tube:

A	В
COMPONENT	VOLUME
Purified PCR1 DNA (Step 34)	5 μΙ
(blue) Q5 Reaction Buffer (5X)	5 μΙ
(lilac) dNTP Solution Mix	0.5 μΙ
(blue) Q5 Hot Start High-Fidelity DNA Polymerase	0.5 μΙ
(blue) NEBNext IS PCR2 Universal Primer	1 μΙ
(blue) NEBNext i5 Primer*	1 μΙ
SYBR Green (20X)**	0.25 μΙ
(white) Nuclease-free Water	11.75 µl
Total Volume	25 μΙ

^{*} Use one i5 Primer per PCR reaction

Set a 100 µl or 20 µl pipette to 20 µl and then pipette the entire volume up and down at least 10 times to mix thoroughly. Perform a quick spin to collect all liquid from the sides of the tube.

37

Place the tube on a qPCR instrument and run the following PCR cycling program:

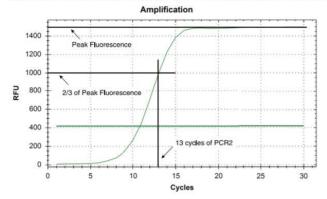

Α	В	С	D
CYCLE STEP	TEMP	TIME	CYCLES
Initial Denaturation	98°C	60 seconds	1
Denaturation	98°C	10 seconds	30
Annealing and Extension	72°C	30 seconds (fluorescence on*)	
Hold	4°C	∞	

^{*} Select the SYBR channel.

^{** 20}X working stock of SYBR Green can be made by diluting 1 µl (10,000X) SYBR Green (Life Technologies #S7563) into 399 µl DMSO and stored at 4°C for up to a month. You only need 0.2 x SYBR final in the qPCR reaction.

The amplification curve for each sample is used to determine the optimal number of PCR cycles to use during PCR2 (Section: PCR2 for Final Library). The PCR cycle number is approximated by determining the cycle number (round down to the nearest whole number) corresponding to 2/3 of the peak fluorescence (see example in Figure 3; in this example 13 PCR cycles will be used in Section: PCR2 for Final Library).

Figure 3. Determining cycle number for PCR2 using amplification curve of sample from a qPCR run.

PCR2 for Final Library

39

Add the following components to a sterile strip tube:

Α	В
COMPONENT	VOLUME
Purified PCR1 DNA (Step 34)	10 μΙ
(blue) Q5 Reaction Buffer (5X)	10 μΙ
(lilac) dNTP Solution Mix	1 μΙ
(blue) Q5 Hot Start High-Fidelity DNA Polymerase	1 μΙ
(blue) NEBNext IS PCR2 Universal Primer	2 μΙ
(blue) NEBNext i5 Index Primer*	2 μΙ
(white) Nuclease-free Water	24 μΙ
Total Volume	50 μl

^{*} Use one i5 Primer per PCR reaction

40

Set a 100 µl pipette to 40 µl then pipette the entire volume up and down at least 10 times to mix thoroughly. Perform a quick spin to collect all liquid from the sides of the tube.

41

Place the tube on a thermal cycler and run the following PCR cycling program:

A	В	С	D
CYCLE STEP	TEMP	TIME	CYCLES
Initial Denaturation	98°C	60 seconds	1
Denaturation	98°C	10 seconds	X*
Annealing and Extension	72°C	30 seconds	
Hold	4°C	∞	

^{*} Use number of cycles determined from Step 38. If qPCR was not done, see Table 1 for recommended number of PCR cycles. In this case the number of PCR cycles should be chosen based on input amount and sample type. The number of cycles should be high enough to provide sufficient library fragments for a successful sequencing run, but low enough to avoid PCR artifacts and over-cycling (high molecular weight fragments on Bioanalyzer).

Table 1. For enriched B Cell or T Cell RNA input, PCR2 cycle number is recommended as in the table:

Α	В	С
TOTAL RNA INPUT	PCR1 ASSAY PCR2	CYCLE NUMBER
B Cell RNA 1,000 ng	BCR	6-7
B Cell RNA 100 ng	BCR	9-10
B Cell RNA 10 ng	BCR	13-14
T Cell RNA 1,000 ng	TCR	10-11
T Cell RNA 100 ng	TCR	12-13
T Cell RNA 10 ng	TCR	17-18

If B and T cells are combined, choose a PCR2 cycle number in between the recommendations for B cell and T cell RNA.

Cleanup of PCR2 Amplification to Obtain Final Libraries

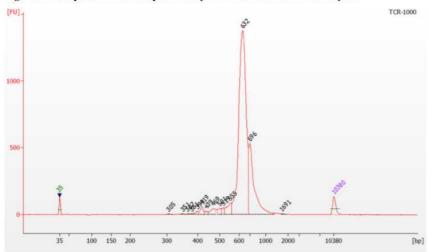

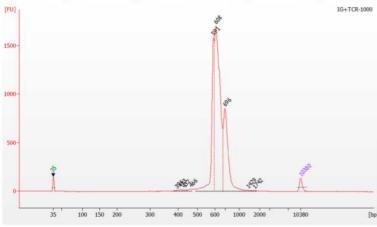

Figure 6. Example of B Cell Receptor chains and T Cell Receptor chains library size distribution on a Bioanalyzer.

Sequencing and Data Analysis

57 Sequencing should be performed on an Illumina MiSeq, using Illumina V3 sequencing chemistry. We recommend running 300 PE using a 600-cycle V3 MiSeq reagent kit with the index read between the first and second read.

For information on data processing please refer to Data Usage Guideline Page within the "Usage Guidelines & Tips" panel in the "Other Tools & Resources" tab at: https://www.neb.com/products/e6320-nebnext-immune-sequencing-kit-human#Product%20Information

We have developed and optimized a pipeline for processing of data directly from FASTQ files using open-source bioinformatics tools. Details on this pipeline can be found at:

https://usegalaxy.org/u/bradlanghorst/w/presto-nebnext-immune-seq-workflow-v320.

Index Pooling Guidelines

For more detailed indexing information please refer to the manual for NEBNext Multiplex Oligos for Illumina (Dual Index Primers Set 1), NEB #E7600.

https://www.neb.com/-/media/nebus/files/manuals/manuale7600.pdf?rev=66702217f5614fae834024da17e8009b&hash=10C7820E5CB9543B5446A574B2DF2B31

For multiplexing samples, use Table 1 for some valid index combinations.
